# CRT Energy Saver

The Windows 9 Technical Specifications mention a new power-saving feature for old-style displays called "CRT Energy Saver." It sounds like a program that blanks the screen when you're not using it, and that's what it does, too, but just in a different way. But it's not just a blank screen. There is a lot of nifty stuff going on behind the scenes here. The "live black" feature is similar to the screensavers that have been popular for many years, but it's much better in several ways. For example, it won't bother your active programs or windows, and it's not just a simple image that persists after you close the program. It uses the video output of the computer to simulate a CRT, so you won't see any of the fancy RGB hue or gamma effects on your monitor, but the black color you see is very accurately simulating the screen of a CRT. You can customize the display, and the utility can update it as the pixels on the screen change, so you will be getting the latest information on the performance of your monitor. The most interesting thing I noticed is that, according to the documentation, CRT Energy Saver can simultaneously monitor the two displays on your computer. It even lets you customize the settings for both monitors. CRT Energy Saver is a free utility that runs whenever your PC starts up and stays running until you shut down Windows. I haven't tested it extensively, but it appears to work fine on my old monitor. The documentation says that it can also use the HDMI output of your graphics card for a more accurate simulation of a CRT monitor. I haven't tested that part. In any case, I think this is a very cool concept and a nifty new tool for all of us old-style users. Link:

## What's New in the?

CRT Energy Saver is an application that allows you to reduce your energy bills by turning off portions of your computer's monitor. It works by showing the normal status of Windows desktop and application icons that are not in use. The blue squares are the areas where CRT Energy Saver turns off the monitor. The program uses the same concept as Sleep but prevents a green button from appearing at the bottom of your taskbar in Windows XP and Windows Vista. While not actually in sleep mode, it looks like the screen is going off. With this application, you can still see your programs, wallpaper and system tray icons. After you use the program, it returns to its previous state.
